

The issue of loneliness among the elderly from a life course perspective

Leen Heylen

University of Antwerp, Belgium

Outline

- Relevance
- Research question
- Impact of increasing diversity on issue of loneliness among the elderly
- Conceptual model
- Concluding remarks

Relevance

- Stereotype view of the ‘lonely elderly’
- Increasing concern
 - Number of single elderly increases (whether divorced or widowed) → *More loneliness among the elderly?*
 - Individualization → *More loneliness among the elderly?*
- Loneliness = important indicator of well-being, strongly correlates with health

Research question

- 30% of the elderly (aged 55+) moderately or strongly lonely
 - Diversity among the elderly increases (divorced elderly, differentiation 'younger' and 'older elderly', ...)
 - ⇒ Loneliness ~ singleness: too simplistic?
- ⇒ How to understand loneliness among the elderly considering these changes?

Increasing diversity

→ *implications for the issue of loneliness?*

- **‘Second demographic transition’**: increasing proportion of divorced elderly ⇒ divorced elderly more lonely?

Figure : Divorce rate by age and country

Source: SHARE 2005

Increasing diversity

→ *implications for the issue of loneliness?*

■ Process of individualization

- Current elderly experienced these changes at an older age
- *Nevertheless:*
 - Increasing complexity in partner relationships among the elderly: cohabiting, living apart together, ...
 - Changing attitudes → more autonomy (de Jong-Gierveld, 2006)

Increasing diversity

→ *implications for the issue of loneliness?*

■ Ageing of the population

- Postponement of widowhood

- Differentiation: 'young old' versus 'old old'

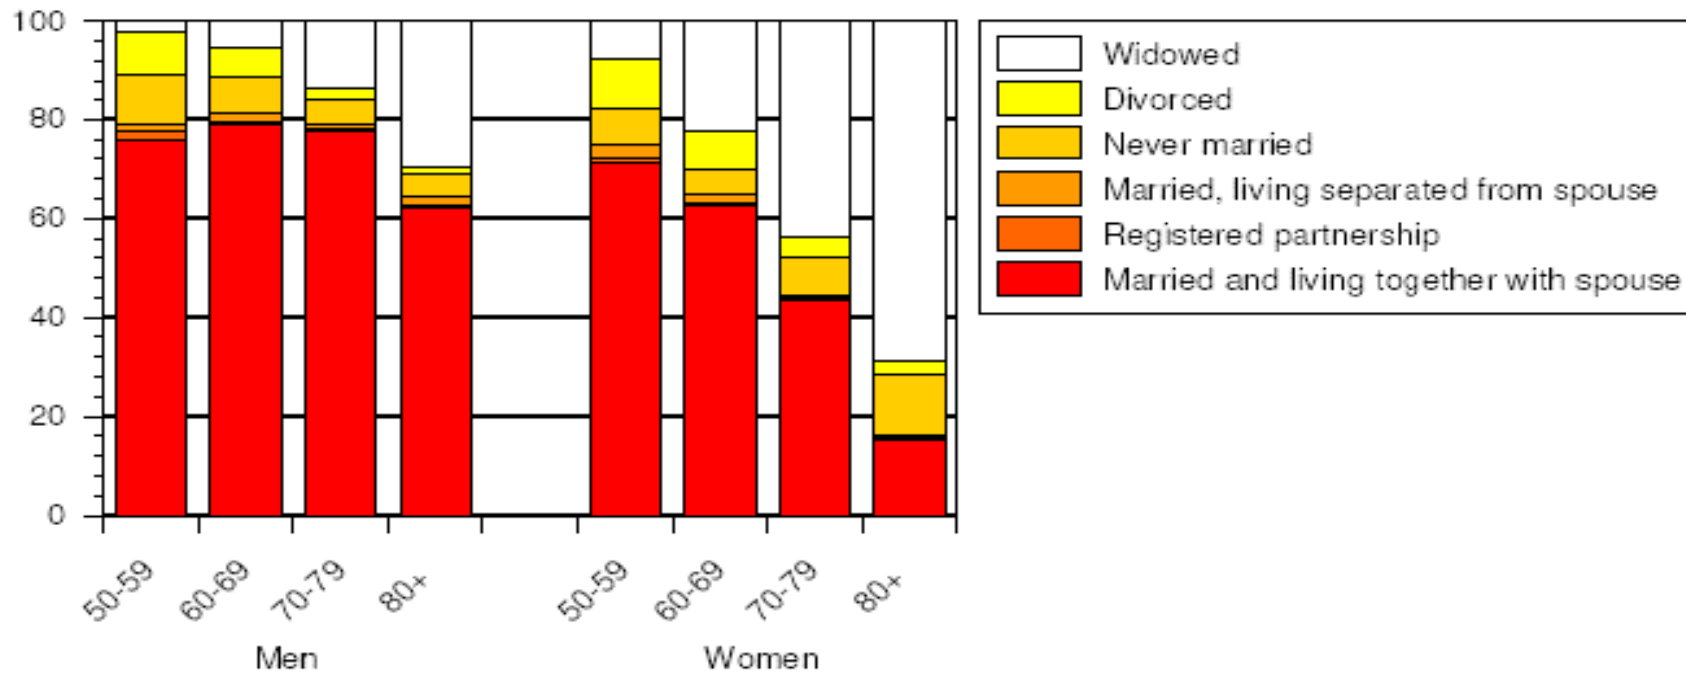

- ▶ Significant changes in the advanced age

Increasing diversity

→ *implications for the issue of loneliness?*

- Increasing differentiation among the elderly

Figure: Marital status in percentage by age and gender at European level

Increasing diversity versus current state of research on loneliness

■ Socio-demographic changes

- Leitmotiv: changes in partner relationships during the life course ⇒ call for a dynamic approach
- Current state of research:
 - Underscores this dynamic approach: partner history (*life course*)
 - *However*: only the direct effects of the partner history were empirically validated (see Dykstra & de Jong-Gierveld, 2004)
 - The mechanisms which cause loneliness, starting from this life course perspective, were not yet empirically tested

Towards a conceptual model

- *Purpose:* to understand how the life course affects loneliness
 - Elaborating a conceptual model starting from this life course perspective which takes into account the challenges caused by the socio-demographic changes on the issue of loneliness
(the effect of changes on the macro level on the micro level)

Towards a conceptual model

- Starting point: distinction between social and emotional loneliness (Weiss, 1973)
 - Absence attachment figure → emotional loneliness
 - Absence social contacts → social loneliness

 - Relevant distinction considering changes
 - e.g. : life event of widowhood
 - Loss of a partner → emotional loneliness ↗
 - Increasing social support → no change in amount of social loneliness
- ⇒ Considers the differentiated impact of crucial life events on loneliness

Towards a conceptual model

■ Cognitive approach:

- Loneliness = subjective experience, resulting from the discrepancy between the achieved and desired interpersonal relationships (Perlman et al., 1981)

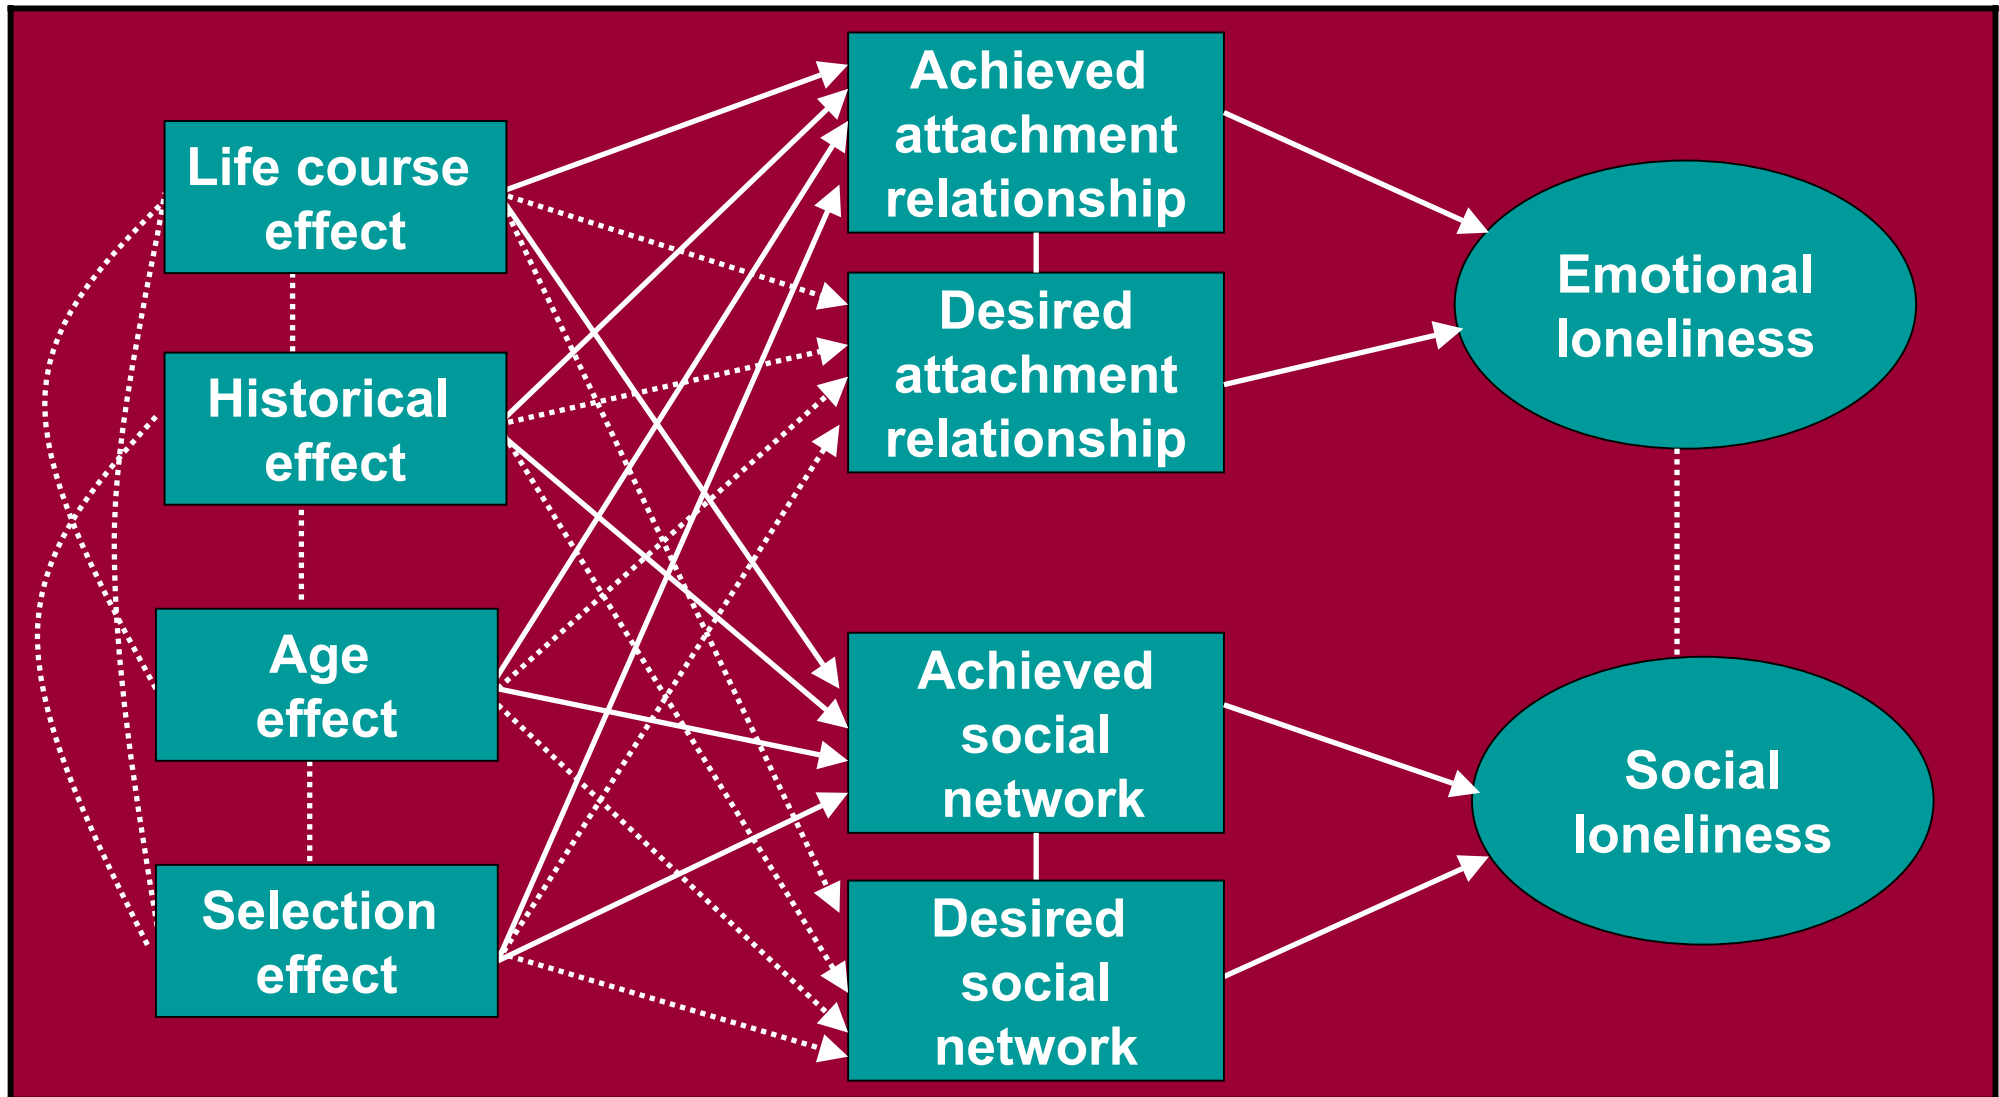

Towards a conceptual model

■ Life course perspective

- Life course theory links the individual life course with the social and historical context and the developmental process (Elder et al., 2003)
- Relevant concepts:
 - Trajectory
 - Transition
 - Sequence, timing, duration, ...
- *Application*: conceptual distinction (Kalmijn, 2002):
 - Transition / life course effect (*i.e. partner history*)
 - Historical effect
 - Age effect
 - Selection effect

Conceptual model

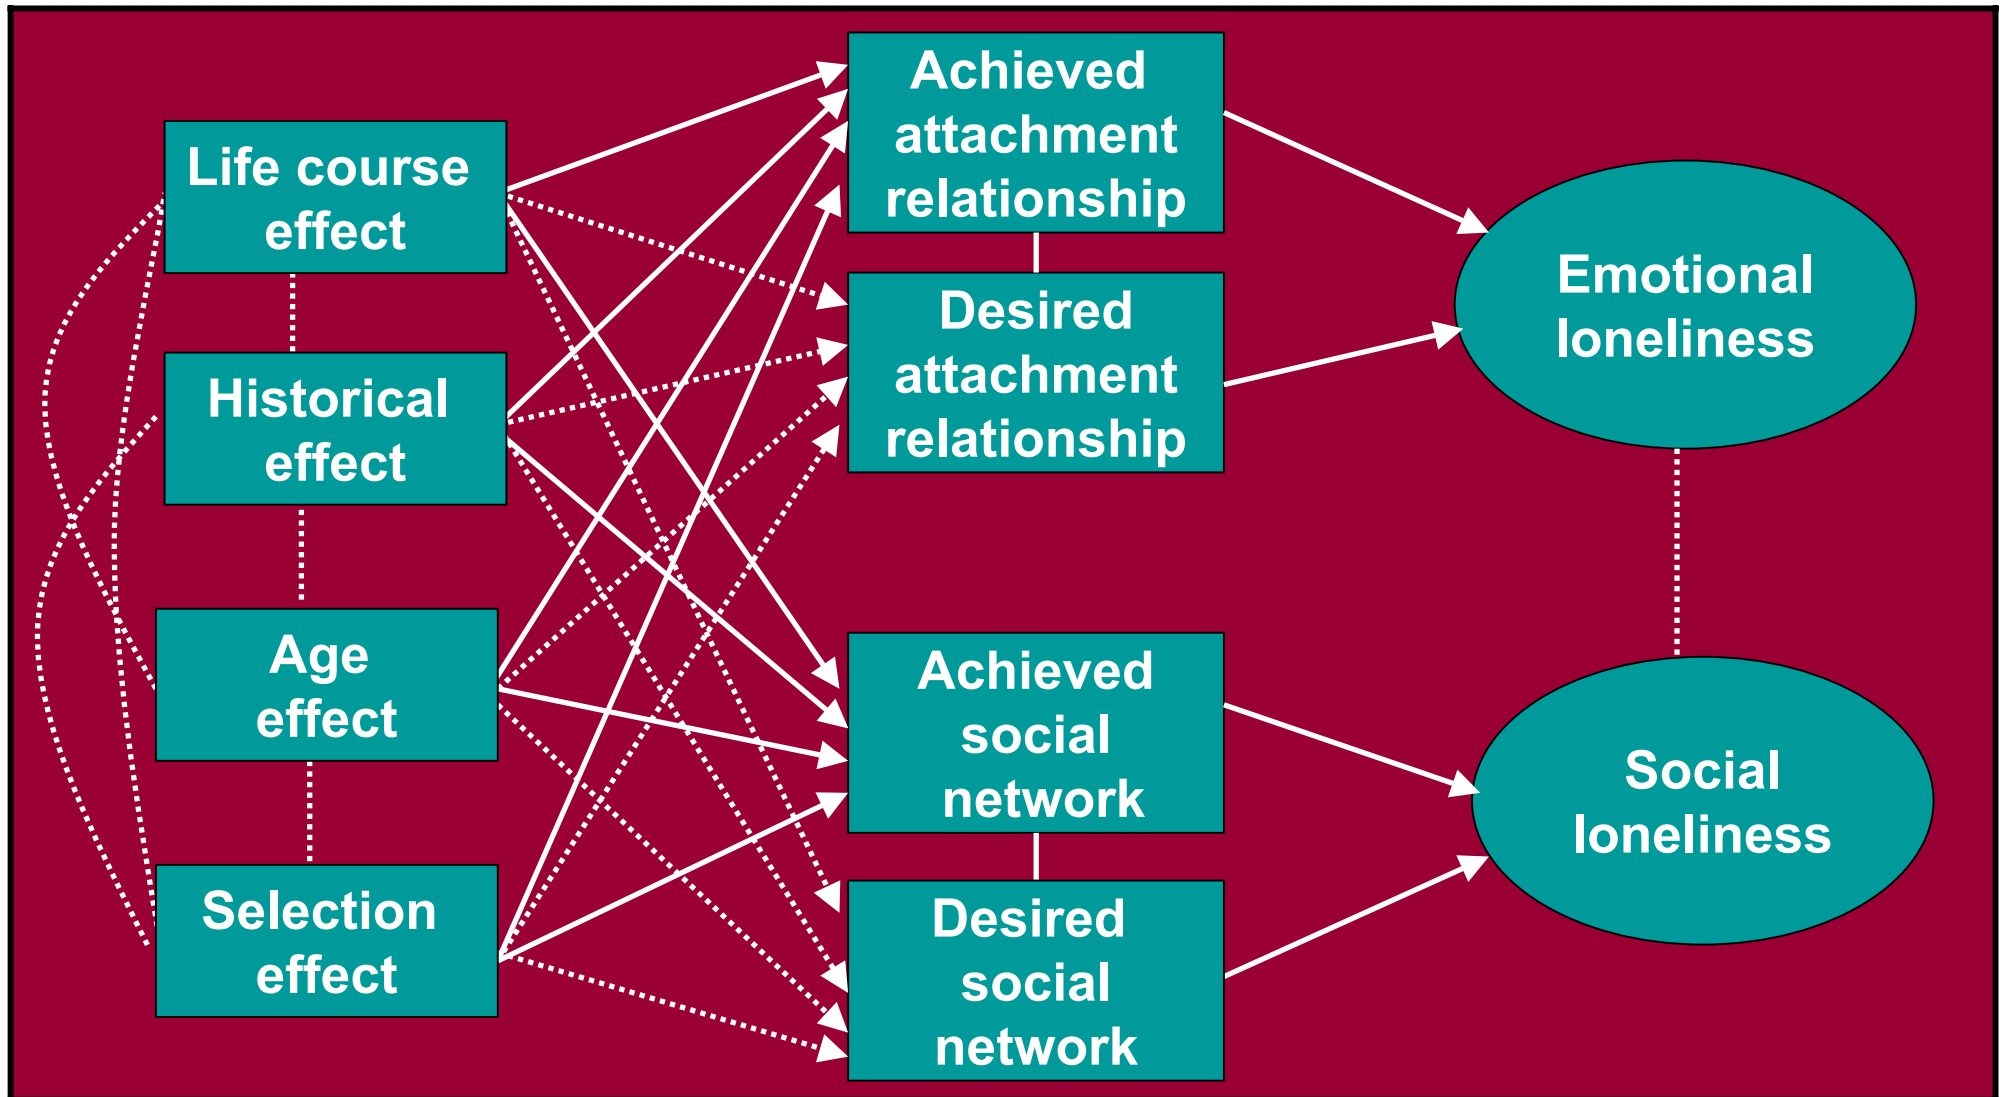

Concluding remarks

- *Purpose:* link the potential impact of changes at the macro level on the specific situation of the elderly, i.e. loneliness among the elderly (micro)

⇒ Conceptual model on loneliness from a life course perspective

- A framework which counters this increasing diversity
 - Partner history → increasing diversity in partner relationships
 - Age effect → differentiation ‘youngest old’ – ‘oldest old’
 - Including attitudes and expectations → individualization
- Considers the processes which are at stake
(e.g. the interaction between age, health and social loneliness)

Discussion

The issue of loneliness among the elderly from a life course perspective

Further plans

- Formulate hypotheses within this framework
 - focus on process

- Empirical validation of the model:
 - Structural equation models
 - Panel Study Belgian Households, wave 9, 2000 (N=1828, 55+)
